

Assignment 6 : Creating a Simple Web Server with Node.js

Objective: Build a basic web server using the Node.js http module to handle different routes and serve corresponding HTML pages.

Instructions:

Create a new Node.js project with a main file (e.g. **server.js**).

Use the `http` module to create a server.

Implement routing to serve different HTML pages based on the requested routes.

Create at least three HTML pages, each representing a different route. Or you can use the Pages you made in the Laundry Website.

Test your server by accessing different routes in a web browser.

Requirements:

The server should listen on a specified port (e.g., 3000).

Implement routes for the following paths:

- `/home`: Serve the HTML page for the home route.
- `/about`: Serve the HTML page for the about route.
- `/contact`: Serve the HTML page for the contact route.

Include appropriate HTTP status codes in your responses.

Use asynchronous and modular code where applicable.

Include error handling for invalid routes with a custom 404 page.

Enhance your server by:

Adding CSS styling to your HTML pages.

Handling additional routes with meaningful content.

Submission Guidelines:

Copy the code in Google Doc and submit the link there.

(you can provide github repo link also else upload files to google drive and share the link) make sure to provide view access to anyone with the link

Include comments in your code to explain key sections.

Provide a brief explanation of how your server works.

Note: Make sure to test your server thoroughly and include screenshots or logs demonstrating the successful handling of different routes.
