

## Assignment 7 : Identifying APIs for To-Do List App

### Objective:

Identify and plan the necessary APIs for a To-Do List app. Focus on outlining the key functionalities and endpoints required for all operations which we will do in the app.

### Instructions:

In the previous classes, you've been developing a To-Do List app using React.js. Now, let's shift our focus to planning the necessary APIs without actual implementation. Consider the following tasks and brainstorm the APIs needed for each functionality:

For Example You Need to Add a task so you can make pointers like these

#### 1. Add Task:

- Identify the API endpoint for creating a new task.
- Determine the information to be included in the request body for creating a task.
- Outline the logic for generating a unique identifier for each task.

### Submission Guidelines:

Create a Google Doc outlining the identified APIs, including endpoint URLs, HTTP methods, expected request body formats, and expected responses. Include explanations for the reasoning behind each identified API. Provide a brief overview of how these APIs collectively fulfil the CRUD operations for a To-Do List app. Comment on any potential challenges you foresee in implementing these APIs.

### Submission Guidelines:

Submit the Google Doc Link  
Provide a brief explanation of how your APIs work.

### Note:

- Focus on planning and identifying the necessary APIs; actual implementation will be carried out in subsequent classes.
  - Consider the principles of RESTful design in identifying APIs.
-
